

# Identification and Correction of Errors in Various Components of Dynamics and Physics of the Global Forecast System (GFS) Model

Arindam Chakraborty<sup>1</sup> and E N Rajagopal<sup>2</sup>

<sup>1</sup> Indian Institute of Science, Bangalore, India.

<sup>2</sup> National Centre for Medium Range Weather Forecasting,  
Noida, India.

*This study is a close collaborative work with the project entitled “**Sensitivity Studies of Indian Summer Monsoon Forecast Modeling**” by Prof T N Krishnamurti, Florida State University.*

# Objectives

- The primary objectives of this study are:
  1. To identify the sources of errors in the high-resolution GFS model that was identified as the primary model for studying summer monsoon over India under the National Monsoon Mission.
  2. Use the information learnt in point (1) above to statistically correct those components of the model and thus by improve its forecast skill.

# Model Used

## Global Forecast System

| Model                  | Version                      | Resolution                   | Forecast Length (hrs) | Wall Clock Time (hrs) |
|------------------------|------------------------------|------------------------------|-----------------------|-----------------------|
| <b>GFS<br/>T574L64</b> | <b>GFS version<br/>9.0.1</b> | <b>~22 km/<br/>64 levels</b> | <b>168</b>            | <b>5</b>              |
|                        |                              |                              |                       |                       |

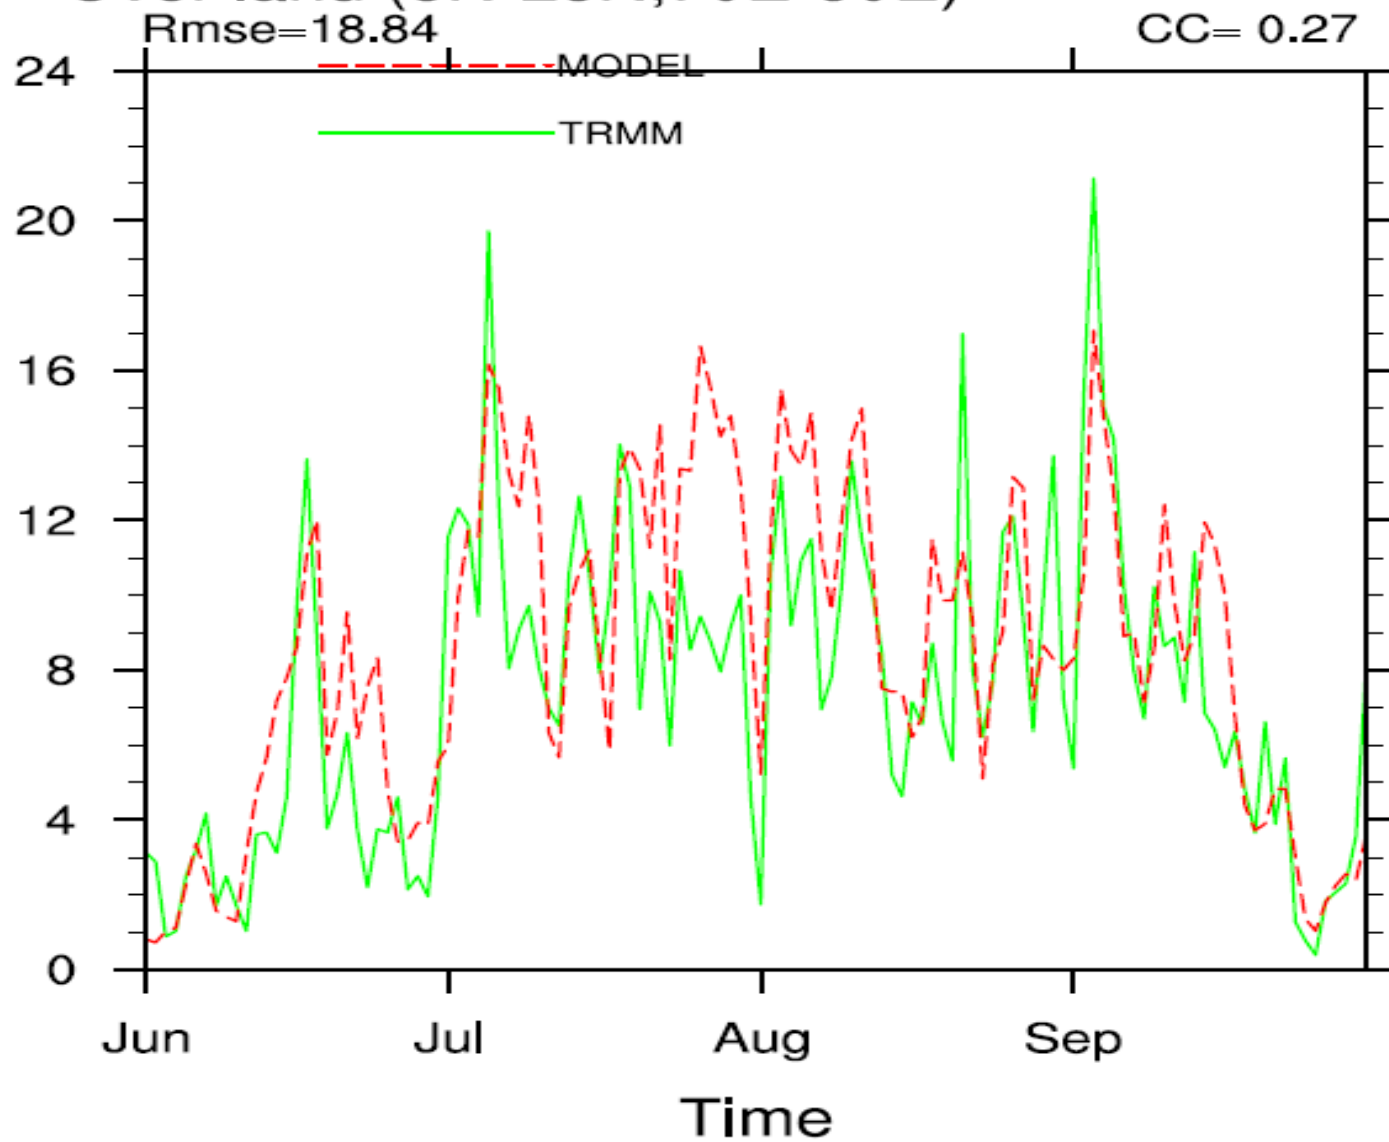

| Physics                               | Scheme  |
|---------------------------------------|---|
| Surface Fluxes                        | Monin-Obukhov similarity  |
| Turbulent Diffusion                   | Non-local Closure scheme (Lock et al., 2000)  |
| SW Radiation                          | Rapid Radiative Transfer Model (RRTM2) (Mlawer et al. 1997; Mlawer and Clough, 1998)- aerosols included– invoked hourly   |
| LW Radiation                          | Rapid Radiative Transfer Model (RRTM1) (Mlawer and Clough 1997;1998). –aerosols included-invoked hourly   |
| Deep Convection                       | SAS convection (Han and Pan, 2006)  |
| Shallow Convection                    | Mass flux scheme (Han and Pan, 2010)  |
| Large Scale Condensation              | Large Scale Precipitation (Zhao and Carr ,1997; Sundqvist et al., 1989)   |
| Cloud Generation                      | Based on Xu and Randall (1996)  |
| Rainfall Evaporation                  | Kessler (1969)  |
| Land Surface Processes                | NOAH LSM with 4 soil levels for temperature & moisture (Ek et al., 2003)  |
| Air-Sea Interaction                   | Roughness length by Charnock (1955), Observed SST, Thermal roughness over the ocean is based on Zeng et al., (1998). 3-layer Thermodynamic Sea-ice model (Winton, 2000) |
| Gravity Wave Drag & mountain blocking | Lott and Miller (1997), Kim and Arakawa (1995), Alpert et al., (1996)   |
| Vertical Advection                    | Flux-Limited Positive-Definite Scheme (Yang et al., 2009)   |

# Experimental Details

- Model was integrated for 7 days starting every 00 GMT of 1 June through 30 September 2012.
- Output was stored at 6-hour interval.
- In addition to storing regular parameters like precipitation, temperature and winds, tendencies of temperature and moisture from various components of model physics and dynamics were also stored. *This includes the convection scheme, the boundary layer scheme, and the radiation scheme, among others.*

Need for physical initialization of precipitation?

# Error in Time-Mean

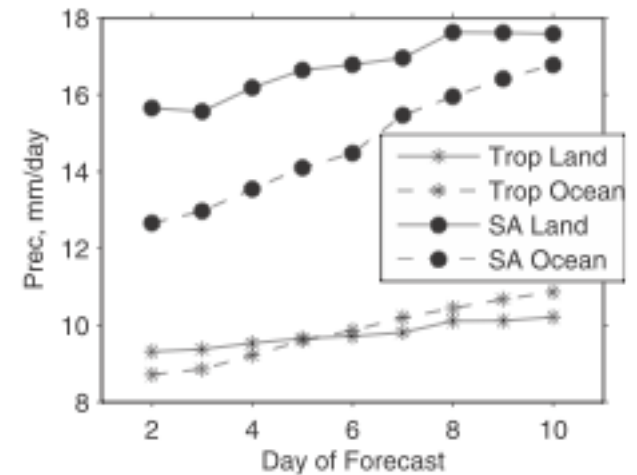

- Rate of growth of RMS error is similar over south Asian land and ocean.
- Error in spatial pattern of forecast decreases sharply over ocean than that over land.

## GFS2 (2012)

Faster growth of error over tropical ocean than over land. This is not so obvious over SA.

## ECMWF (2008)

# Conclusions

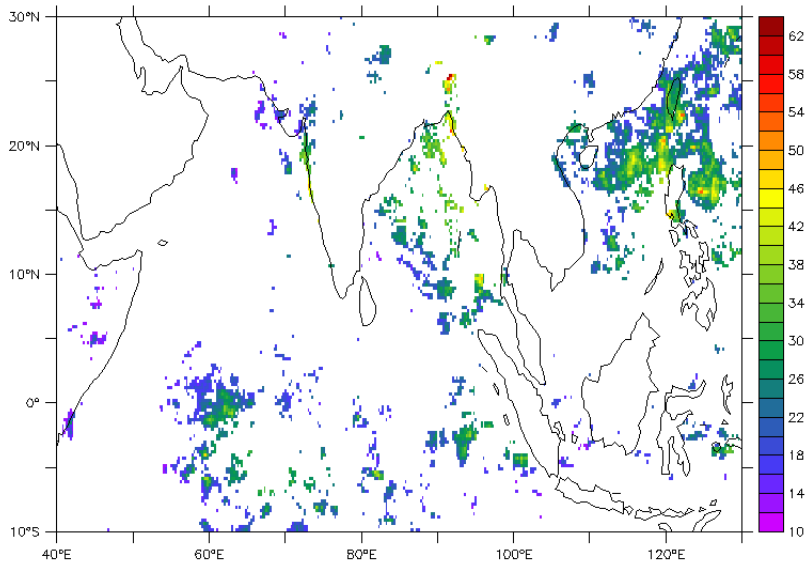

- High error in precipitation is noticed over land during first 12 hours of forecast. This is possibly because of lack in precipitation initialization in the model.
- Error in spatial pattern in mean precipitation is low over ocean than that over land. However, the rate of decrease of error over ocean is larger than over land.
- Unlike that over land, error over ocean at long lead time is confined to over regions with large day-to-day variability but low mean in precipitation. This possibly indicates lack in air-sea coupling in the model.
- Large error is noticed is precipitation diurnal cycle over Indian land and Bay of Bengal. Most of the bias in the model can be attributed to the error in diurnal cycle in model precipitation.

## Future Work

- Implement the correction terms inside the model.
- Model simulation for JJAS2012 and compare the forecast skill with control.
